

Trigonometric ratios, Mixed Exercise 9

1

- a Using area of $\triangle ABC = \frac{1}{2}ac \sin B$
 $10 \text{ cm}^2 = \frac{1}{2} \times 6 \times 8 \times \sin \theta^\circ \text{ cm}^2$
 So $10 = 24 \sin \theta^\circ$
 So $\sin \theta^\circ = \frac{10}{24} = \frac{5}{12}$
 $\Rightarrow \theta = 24.6$ or 155 (3 s.f.)
 As θ is obtuse, $\angle ABC = 155^\circ$ (3 s.f.)

- b Using the cosine rule
 $b^2 = a^2 + c^2 - 2ac \cos B$
 $AC^2 = 8^2 + 6^2 - 2 \times 8 \times 6 \times \cos B$
 $= 187.26 \dots$
 $AC = 13.68 \dots$
 The third side has length 13.7 m (3 s.f.)

2 a

- Using the cosine rule
 $\cos x^\circ = \frac{3^2 + 1.2^2 - 2.4^2}{2 \times 3 \times 1.2}$
 $= 0.65$
 $x = \cos^{-1}(0.65)$
 $= 49.458 \dots$
 $x = 49.5$ (3 s.f.)

- Using the area of a triangle formula
 $\text{area} = \frac{1}{2} \times 1.2 \times 3 \times \sin x^\circ \text{ cm}^2$
 $= 1.37 \text{ cm}^2$ (3 s.f.)

2 b

Using the sine rule

$$\frac{\sin x^\circ}{5} = \frac{\sin 80^\circ}{6}$$

$$\sin x^\circ = \frac{5 \sin 80^\circ}{6}$$

$$= 0.8206 \dots$$

$$x = 55.2$$
 (3 s.f.)

The angle between the 5 cm and 6 cm sides is $180^\circ - (80 + x)^\circ = (100 - x)^\circ$.

Using the area of a triangle formula:
 $\text{area} = \frac{1}{2} \times 5 \times 6 \times \sin (100 - x)^\circ \text{ cm}^2$
 $= 10.6 \text{ cm}^2$ (3 s.f.)

c

Use the sine rule to find the angle opposite the 3 cm side. Call this y° .

$$\frac{\sin y^\circ}{3} = \frac{\sin 40^\circ}{5}$$

$$\sin y^\circ = \frac{3 \sin 40^\circ}{5}$$

$$\Rightarrow y = 22.68 \dots$$

So $x = 180 - (40 + y)$
 $= 117$ (3 s.f.)

Area of triangle $= \frac{1}{2} \times 3 \times 5 \times \sin x^\circ$
 $= 66.6 \text{ cm}^2$ (3 s.f.)

3

Use the cosine rule to find angle A.

$$\begin{aligned} \cos A &= \frac{3^2 + 5^2 - 7^2}{2 \times 3 \times 5} \\ &= -0.5 \\ A &= \cos^{-1}(-0.5) \\ &= 120^\circ \end{aligned}$$

$$\begin{aligned} \text{Area of triangle} &= \frac{1}{2} \times 3 \times 5 \times \sin A \text{ cm}^2 \\ &= 6.495 \dots \text{cm}^2 \\ &= 6.50 \text{ cm}^2 \text{ (3 s.f.)} \end{aligned}$$

4 a

$$\text{In } \triangle BDA, \frac{BD}{8.2} = \sin 30.6^\circ$$

$$\begin{aligned} \text{So } BD &= 8.2 \sin 30.6^\circ \\ &= 4.174 \dots \end{aligned}$$

$$\frac{AD}{8.2} = \cos 30.6$$

$$AD = 8.2 \cos 30.6 = 7.0580 \dots$$

$$\begin{aligned} \angle ABD &= 90^\circ - 30.6^\circ \\ &= 59.4^\circ \end{aligned}$$

We can use AD and BD to calculate the area of $\triangle ABD$ or use:

$$\begin{aligned} \text{Area of } \triangle ABD &= \frac{1}{2} \times 8.2 \times BD \times \sin 59.4^\circ \\ &= 14.7307 \dots \text{cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Area of } \triangle BDC &= \frac{1}{2} \times 10.4 \times BD \times \sin 100^\circ \\ &= 21.375 \dots \text{cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Total area} &= \text{area } \triangle ABD + \text{area } \triangle BDC \\ &= 36.1 \text{ cm}^2 \text{ (3 s.f.)} \end{aligned}$$

4 b

$$\frac{\sin \angle ADB}{3.9} = \frac{\sin 75^\circ}{4.8}$$

$$\sin \angle ADB = \frac{3.9 \sin 75^\circ}{4.8}$$

$$\begin{aligned} \angle ADB &= \sin^{-1}\left(\frac{3.9 \sin 75^\circ}{4.8}\right) \\ &= 51.7035 \dots^\circ \end{aligned}$$

$$\begin{aligned} \text{So } \angle ABD &= 180^\circ - (75^\circ + \angle ADB)^\circ \\ &= 53.296 \dots^\circ \end{aligned}$$

$$\begin{aligned} \text{Area of } \triangle ABD &= \frac{1}{2} \times 3.9 \times 4.8 \times \sin \angle ABD \\ &= 7.504 \dots \text{cm}^2 \end{aligned}$$

$$\begin{aligned} \text{In } \triangle BDC, \angle BDC &= 180^\circ - \angle ADB \\ &= 128.29 \dots^\circ \end{aligned}$$

$$\begin{aligned} \text{Area of } \triangle BDC &= \frac{1}{2} \times 2.4 \times 4.8 \times \sin \angle BDC \\ &= 4.520 \dots \text{cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Total area} &= \text{area } \triangle ABD + \text{area } \triangle BDC \\ &= 12.0 \text{ cm}^2 \text{ (3 s.f.)} \end{aligned}$$

5

a Using the cosine rule:

$$b^2 = a^2 + c^2 - 2ac \cos B$$

$$(5\sqrt{13})^2 = (a\sqrt{3})^2 + 10^2$$

$$-2 \times a\sqrt{3} \times 10 \times \cos 150^\circ$$

$$325 = 3a^2 + 100 + 30a$$

$$3a^2 + 30a - 225 = 0$$

$$a^2 + 10a - 75 = 0$$

$$(a+15)(a-5) = 0$$

$$\Rightarrow a = 5 \text{ as } a > 0$$

5 b Area $\Delta ABC = \frac{1}{2} \times 10 \times 5\sqrt{3} \times \sin 150^\circ$
 $= 12.5\sqrt{3} \text{ cm}^2$

6

Using the area formula:

$$1 = \frac{1}{2} \times 2 \times \sqrt{2} \times \sin \theta^\circ$$

$$\Rightarrow \sin \theta^\circ = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \theta = 45 \text{ or } 135$$

But as θ is not the largest angle, θ must be 45.

Use the cosine rule to find x .

$$x^2 = 2^2 + (\sqrt{2})^2 - 2 \times 2 \times \sqrt{2} \times \cos 45^\circ$$

$$x^2 = 4 + 2 - 4 = 2$$

$$\text{So } x = \sqrt{2}$$

So the triangle is isosceles with two angles of 45° . It is a right-angled isosceles triangle.

7

a Use Pythagoras' theorem.

$$AC = \sqrt{(1-0)^2 + (3-1)^2}$$

$$= \sqrt{5}$$

$$= b$$

$$BC = \sqrt{(3-1)^2 + (4-3)^2}$$

$$= \sqrt{5}$$

$$= a$$

7 a $AB = \sqrt{(3-0)^2 + (4-1)^2}$
 $= \sqrt{18}$
 $= c$

Using the cosine rule

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

$$\cos C = \frac{5 + 5 - 18}{2 \times \sqrt{5} \times \sqrt{5}}$$

$$= \frac{-8}{10}$$

$$= \frac{-4}{5}$$

Find $\sin C$ by using the identity,

$\cos^2 x + \sin^2 x = 1$ or by drawing a 3,4,5 triangle and looking at the ratio of the sides.

b Using the area formula:

$$\text{area of } \Delta ABC = \frac{1}{2} ab \sin C$$

$$= \frac{1}{2} \times \sqrt{5} \times \sqrt{5} \times \sin C$$

$$= 1.5 \text{ cm}^2$$

8

a Using the cosine rule

$$(2x-1)^2 = (x+1)^2 + (x-1)^2$$

$$- 2(x+1)(x-1)\cos 120^\circ$$

$$4x^2 - 4x + 1 = (x^2 + 2x + 1)$$

$$+ (x^2 - 2x + 1) + (x^2 - 1)$$

$$4x^2 - 4x + 1 = 3x^2 + 1$$

$$x^2 - 4x = 0$$

$$x(x-4) = 0$$

$$\Rightarrow x = 4 \quad x > 1$$

b Area of $\Delta = \frac{1}{2} \times (x+1) \times (x-1) \times \sin 120^\circ$

$$= \frac{1}{2} \times 5 \times 3 \times \sin 120^\circ$$

$$= \frac{1}{2} \times 5 \times 3 \times \frac{\sqrt{3}}{2}$$

8 b Area of $\Delta = \frac{15\sqrt{3}}{4}$
 $= 6.50 \text{ cm}^2$ (3 s.f.)

9 a $b^2 = a^2 + c^2 - 2ac \cos B$
 $= 1.4^2 + 1.2^2 - 2 \times 1.4 \times 1.2 \times \cos 70^\circ$
 $= 1.96 + 1.44 - 1.14918768$
 So $b = 1.500027\dots$
 So point C is 1.50 km from the park keeper's hut.

b $\frac{\sin A}{a} = \frac{\sin B}{b}$
 $\frac{\sin A}{1.4} = \frac{\sin 70^\circ}{1.5}$
 $\sin A = \frac{1.4 \sin 70^\circ}{1.5}$
 So $A = 61.28810^\circ$
 Bearing $= 360^\circ - (180^\circ - 61.28810^\circ)$
 $= 241.29^\circ$
 The bearing of the hut from point C is 241° .

c Area of $\Delta = \frac{1}{2}ac \sin B$
 $= \frac{1}{2} \times 1.4 \times 1.2 \times \sin 70^\circ$
 $= 0.78934\dots$
 $= 0.789 \text{ km}^2$ (3 s.f.)

10

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

$$\cos A = \frac{20^2 + 15^2 - 12^2}{2(20)(15)}$$

$$\cos A = \frac{400 + 225 - 144}{600}$$

So $A = 36.7^\circ$
 Area of one sail $= \frac{1}{2}bc \sin A$
 $= \frac{1}{2} \times 20 \times 15 \times \sin 36.7^\circ$
 $= 89.665\dots$
 Area of all four sails $= 359 \text{ m}^2$ (3 s.f.)

11

Using triangle ABD, the angles are 15° , 148° and 17° .

$$\frac{b}{\sin B} = \frac{d}{\sin D}$$

$$\frac{b}{\sin 148^\circ} = \frac{75}{\sin 17^\circ}$$

$$b = \frac{75 \sin 148^\circ}{\sin 17^\circ}$$

$b = 135.936\dots$

Using the larger right-angled triangle:

$$\sin 15^\circ = \frac{\text{height}}{135.936}$$

height $= 135.936 \sin 15^\circ$
 $= 35.1829\dots$

The height of the church tower is 35.2 m (3 s.f.).

12 a A stretch of scale factor 2 in the x direction.

b A translation of +3 in the y direction.

c A reflection in the x -axis.

d A translation of 20 in the negative x direction (i.e. 20 to the left).

13 a

b $\tan(x - 45^\circ) + 2\cos x = 0$

$\tan(x - 45^\circ) = -2\cos x$

The graphs do not intersect so there are no solutions.

- 14 a** As it is the graph of $y = \sin x^\circ$ translated, the gap between A and B is 180, so $p = 300$.
- b** The difference in the x -coordinates of D and A is 90, so the x -coordinate of D is 30. The maximum value of y is 1, so D is the point (30, 1).
- c** For the graph of $y = \sin x^\circ$, the first positive intersection with the x -axis would occur at 180. The point A is at 120 and so the curve has been translated by 60 to the left.

$k = 60$

- d** The equation of the curve is $y = \sin(x + 60)^\circ$.

When $x = 0$, $y = \sin 60^\circ = \frac{\sqrt{3}}{2}$, so $q = \frac{\sqrt{3}}{2}$.

- 15 a** The graph of $y = \sin x$ crosses the x -axis at $(180^\circ, 0)$.
 $f(x) = \sin px$ is a stretch horizontally with scale factor $\frac{36}{180} = \frac{1}{5}$.
 $f(x) = \sin 5x$
 $p = 5$

- b** The period of $f(x)$ is $360 \div 5 = 72^\circ$.

16 a

- b** The four shaded regions are congruent therefore the magnitude of the y value is the same for $\sin \alpha$.
 $\sin \alpha^\circ$ and $\sin(108 - \alpha)^\circ$ have the same y value (call it k).

- 16 b** So $\sin \alpha^\circ = \sin(180 - \alpha)^\circ$, $\sin(180 + \alpha)^\circ$ and $\sin(360 - \alpha)^\circ$ have the same y value, which will be $-k$.
 So $\sin \alpha^\circ = \sin(180 - \alpha)^\circ$
 $= -\sin(180 + \alpha)^\circ$
 $= -\sin(360 - \alpha)^\circ$

17 a

- b i** From the graph of $y = \cos \theta^\circ$, which shows four congruent shaded regions, if the y value at α° is k , then y at $(180 - \alpha)^\circ$ is $-k$, y at $(180 + \alpha)^\circ$ is $-k$ and y at $(360 - \alpha)^\circ$ it is $+k$.

So $\cos \alpha^\circ = -\cos(180 - \alpha)$
 $= -\cos(180 + \alpha)$
 $= \cos(360 - \alpha)$

- ii** From the graph of $y = \tan \theta^\circ$, if the y value at α° is k , then at $(180 - \alpha)^\circ$ it is $-k$, at $(180 + \alpha)$ it is $+k$ and at $(360 - \alpha)$ it is $-k$.

So $\tan \alpha^\circ = -\tan(180 - \alpha)$
 $= +\tan(180 + \alpha)$
 $= -\tan(360 - \alpha)$

18 a

- b** There are 4 complete waves in the interval $0 \leq x \leq 24^\circ$ so there are 4 sand dunes in this model.

18 c The sand dunes may not all be the same height.

Challenge

$$\angle ACB = \tan^{-1} 1 = 45^\circ$$

Show that $\theta + \phi = 45^\circ$

$$\sin \theta = \frac{1}{\sqrt{5}}$$

Using the sine rule:

$$\frac{\sin(180^\circ - \theta - \phi)}{5} = \frac{\sin \theta}{\sqrt{10}}$$

$$\sin(180^\circ - \theta - \phi) = \frac{5 \sin \theta}{\sqrt{10}}$$

Substituting $\sin \theta = \frac{1}{\sqrt{5}}$:

$$\begin{aligned} \sin(180^\circ - \theta - \phi) &= \frac{5 \left(\frac{1}{\sqrt{5}} \right)}{\sqrt{10}} \\ &= \frac{5}{\sqrt{50}} \\ &= \frac{5}{5\sqrt{2}} \\ &= \frac{1}{\sqrt{2}} \end{aligned}$$

$\sin^{-1} \left(\frac{1}{\sqrt{2}} \right) = 45^\circ$, but angle $180^\circ - \theta - \phi$ is

obtuse.

So, $180^\circ - \theta - \phi = 180^\circ - 45^\circ = 135^\circ$

Therefore, $\theta + \phi = 45^\circ$

So, $\angle AEB + \angle ADB = \angle ACB$
