

#### **Review Exercise 1**

1 a A census observes every member of a population.A disadvantage of a census is it would be time-consuming to get opinions from all the employees.OR It would be difficult/time-consuming to process the large amount of data from a census.

- **b** Opportunity sampling.
- c It is not a random sample. The sample only includes cleaners, there are no types of other employees such as managers.
   The first 50 cleaners to leave may be in the same group/shift so may share the same views.
- d i Allocate a number from 1-550 to all employees.
  For a sample of 50, you need every eleventh person since 550 ÷ 50 = 11.
  Select the first employee using a random number from 1 11, then select every eleventh person from the list; e.g. if person 8 is then the sample is 8, 19, 30, 41...
  - ii For this sample, you need  $\frac{55}{550} \times 50 = 5$  managers and  $\frac{495}{550} \times 50 = 45$  cleaners. Label the managers 1–55 and the cleaners 1–495. Use random numbers to select 5 managers and 45 cleaners.
- 2 a Advantage a sampling frame is not required. Disadvantage – sampling errors cannot be calculated.
  - b Advantage very quick to administer.Disadvantage may not be representative of the population.
- **3** a 390 and 372
  - **b** The list is alphabetical and has not been sorted by gender.
  - c Stratified sampling
- 4 Label standard rooms between 1 and 180. Use random numbers in the range 1–180 to select 18 rooms. Label premier rooms between 1 and 100. Use random numbers in the range 1–100 to select 10 rooms. Label executive rooms between 1 and 40. Use random numbers in the range 1–40 to select 4 rooms.

- 5 a P(F < 3R) = P(F 3R < 0)Let X = F - 3R  $E(X) = E(F) - 3E(R) = 238 - 3 \times 82 = -8$   $Var(X) = Var(F) + 3^2Var(R) = 7^2 + 3^2 \times 3^2 = 130$ Hence  $X \sim N(-8, 130)$  P(X < 0) = 0.7586 (4 d.p.) (from calculator or tables)
  - **b** The assumption made is that the duration of the two rides are independent. Validity: this is likely to be the case – two separate control panels operate each ride.
  - c  $D = R_1 + R_2 + R_3$   $E(D) = E(R) + E(R) + E(R) = 3 \times 82 = 246$   $Var(D) = Var(R) + Var(R) + Var(R) = 3 \times 3^2 = 27$ Hence  $D \sim N(246, 27)$
  - d P(|F-D| < 10) = P(-10 < F D < 10)Let Y = F - DE(Y) = 238 - 246 = -8Var(Y) = 49 + 27 = 76Hence  $Y \sim N(-8, 76)$ P(-10 < Y < 10) = P(Y < 10) - P(Y < -10) = 0.5713 (4 d.p.)
- **6 a** E(R) = E(X) + E(Y) = 20 + 10 = 30
  - **b**  $\operatorname{Var}(R) = \operatorname{Var}(X) + \operatorname{Var}(Y) = 4 + 0.84 = 4.84$
  - c  $R \sim N(30, 4.84)$  from parts **a** and **b** P(28.9 < R < 32.64) = P(R < 32.64) – P(R < 28.9) = 0.8849 – 0.3085 = 0.5764 (4 d.p.)

Pearson

9 C = 2A + 5B where  $A \sim N(15, 1.5^2)$  and  $B \sim N(\mu, 2^2)$  $E(C) = 2 \times 15 + 5 \times \mu$  $= 30 + 5\mu$  $\operatorname{Var}(C) = 2^2 \times 1.5^2 + 5^2 \times 2^2$ =109Therefore:  $C \sim N(30 + 5\mu, 109)$ P(C < 83.5) = 0.9 $P\left(Z < \frac{83.5 - (30 + 5\mu)}{\sqrt{109}}\right) = 0.9$  $\frac{83.5 - (30 + 5\mu)}{\sqrt{109}} = 1.282$  $\frac{53.5-5\mu}{\sqrt{109}} = 1.282$  $\mu = \frac{53.5 - 1.282\sqrt{109}}{5}$  $\mu = 8.02 (3 \text{ s.f.})$ **10**  $A \sim N(24, 4^2)$  and  $X \sim N(20, 3^2)$  $B = 3X + \sum_{i=1}^{4} A_i$  $= 3X + A_1 + A_2 + A_3 + A_4$  $E(B) = 3E(X) + E(A_1) + E(A_2) + E(A_3) + E(A_4)$  $= 3 \times 20 + 4 \times 24$ =156 $\operatorname{Var}(B) = 3^{2}\operatorname{Var}(X) + \operatorname{Var}(A_{1}) + \operatorname{Var}(A_{2}) + \operatorname{Var}(A_{3}) + \operatorname{Var}(A_{4})$  $=3^2 \times 3^2 + 4 \times 4^2$ =145P(B > 156) = 0.5 $P(B \le 170) = 1 - P\left(Z < \frac{170 - 156}{\sqrt{145}}\right)$ = P(Z < 1.1626)= 0.8775 $P(156 < B \le 170) = 0.8775 - 0.5$ = 0.3775 $P(B \le 170 | B > 156) = \frac{0.3775}{0.5}$ = 0.755 (3 s.f.)

11 a 
$$E(\overline{X}) = \frac{(5\alpha - 9) + (\alpha - 3)}{2}$$
  
=  $3\alpha - 6$   
 $3\alpha - 6 \neq \alpha$   
Therefore  $E(\overline{X})$  is a biased estimator.  
The bias is  $(3\alpha - 6) - \alpha = 2\alpha - 6$ 

**b** 
$$\mathrm{E}(Y) = \mathrm{E}(k\overline{X}+2)$$

 $=k(3\alpha-6)+2$ 

and if *Y* is an unbiased estimator for  $\alpha$  then  $E(Y) - \alpha = 0$ . So it follows that:  $k(3\alpha - 6) + 2 - \alpha = 0$  $3k(\alpha - 2) = \alpha - 2$ 

$$3k = 1$$
$$k = \frac{1}{3}$$

**c** From the data:

$$\overline{X} = 36.36$$
Using
$$Y = k\overline{X} + 2$$

$$= \frac{1}{3}\overline{X} + 2$$

$$= \frac{1}{3} \times 36.36 + 2$$

$$= 14.12$$

From  $X \sim U(\alpha - 3, 5\alpha - 9)$ , the max value that X can take is estimated as:  $5\alpha - 9 = 5 \times 14.12 - 9$ 

= 61.6

- **12 a** Let *X* be the total weight of 4 randomly chosen adult men.  $X = M_1 + M_2 + M_3 + M_4$   $E(X) = 4 \times 84 = 336$   $Var(X) = 4 \times 11^2 = 484$   $X \sim N(336, 484)$  P(X < 350) = 0.7377 (4 d.p.)
  - **b** Let  $M \sim N(84,121)$  and  $W \sim N(62,100)$  and Y = M 1.5W  $E(Y) = 84 - 1.5 \times 62 = -9$   $Var(Y) = Var(M) + 1.5^2 Var(W) = 11^2 + 1.5^2 \times 10^2 = 346$ So  $Y \sim N(-9,346)$ , and P(Y < 0) = 0.6858 (4 d.p.)
- **13 a**  $E(D) = E(A) 3E(B) + 4E(C) = 5 3 \times 7 + 4 \times 9 = 20$   $Var(D) = Var(A) + 3^2 Var(B) + 4^2 Var(C) = 2^2 + 9 \times 3^2 + 16 \times 4^2 = 341$ So  $D \sim N(20, 341)$ , and P(D < 44) = 0.9031 (4 d.p.)
  - **b**  $E(X) = E(A) 3E(B) + 4E(C) = 5 3 \times 7 + 4 \times 9 = 20$   $Var(D) = Var(A) + Var(B) + Var(B) + Var(B) + 4^2 Var(C) = 2^2 + 3 \times 3^2 + 16 \times 4^2 = 287$ So  $X \sim N(20, 287)$ , and  $P(X > 0) = 1 - P(X \le 0) = 1 - 0.1189 = 0.8811$  (4 d.p.)
- 14 a Let  $W = C_1 C_2$  E(W) = 350 - 350 = 0 Var(W) = 8 + 8 = 16So  $W \sim N(0, 16)$  P(|W| > 6) = 1 - P(W < 6) + P(W < -6) = 0.0668 + 0.0668 = 0.1336 (4 d.p.)
  - **b** Let X = C L E(X) = 350 - 345 = 5 Var(X) = 8 + 17 = 25So  $X \sim N(5, 25)$ P(X > 0) = 1 - P(X < 0) = 1 - 0.1587 = 0.8413 (4 d.p.)

c Let 
$$Y = \sum_{i=1}^{24} C_i + B$$
  
 $E(Y) = 24 \times 350 + 100 = 8500$   
 $Var(Y) = 24 \times 8 + 2^2 = 196$   
So  $Y \sim N(8500, 196)$   
 $P(8510 < Y < 8520) = P(Y < 8520) - P(Y < 8510) = 0.92343 - 0.76247 = 0.1610 (4 d.p.)$ 

d All random variables (each can of cola and the box) are independent and normally distributed.

15 a	
	$\overline{x} = \frac{361.6}{80} = 4.52$
	$\hat{\sigma}^2 = s^2 = \frac{1753.95 - 80 \times \overline{x}^2}{79} = 1.5128$
	or $\hat{\sigma}^2 = s^2 = \frac{80}{79} \times \left(\frac{1753.95}{80} - \overline{x}^2\right) = 1.51$
h	$H_0: \mu_A = \mu_B  H_1: \mu_A > \mu_B$
U	$\mu_0 \cdot \mu_A = \mu_B  \mu_1 \cdot \mu_A > \mu_B$
	$z = \frac{4.52 - 4.06}{\sqrt{\frac{1.5128}{80} + \frac{2.50}{60}}} = \left(\frac{0.46}{\sqrt{0.060576}}\right)$ = 1.8689 or -1.8689 if <i>B</i> - <i>A</i> was used.

Using 
$$\frac{\sum x^2 - n\overline{x}^2}{n-1}$$
 or  $\frac{n}{n-1} \left( \frac{\sum x^2}{n} - \overline{x}^2 \right)$   
5128

Using z =

This is a difference of means test. When stating hypotheses you must make it clear which mean is greater when it is a one-tailed test.

 $\sigma$ 

of the question.

п

quote the figure in full.

Use the percentage point table and

State your conclusion in the context

Variance must be known to use the test.

Remember,  $\sigma^2$  is the population variance and  $s^2$  is an unbiased estimator

of the population variance.

$$z = \frac{4.52 - 4.06}{\sqrt{\frac{1.5128}{80} + \frac{2.50}{60}}} = \left(\frac{0.46}{\sqrt{0.060576}}\right)$$
  
= 1.8689 or -1.8689 if *B* - *A* was used.

One tail c.v. is z = 1.64491.87 > 1.6449 so reject H<sub>0</sub>.

There is evidence that diet A is better than diet B or evidence that (mean) weight lost in the first week using diet A is greater than using diet B.

**c** CLT enables you to assume that  $\overline{A}$  and  $\overline{B}$  are normally distributed since both samples are large.

**d** Assumed 
$$\sigma_A^2 = s_A^2$$
 and  $\sigma_B^2 = s_B^2$ 

16

$$123.5 = \overline{x} - 2.5758 \times \frac{\sigma}{\sqrt{n}}$$
(1)  

$$154.7 = \overline{x} - 2.5758 \times \frac{\sigma}{\sqrt{n}}$$
(2)  

$$\overline{x} = \frac{1}{2}(123.5 + 154.7) = 139.1$$

$$= 15.6$$

$$\frac{\sigma}{\sqrt{n}} = \frac{15.6}{2.5758}$$
So 95% C.I. = 139.1 ± 1.9600 ×  $\frac{15.6}{2.5758}$ 

$$= (127.22..., 150.97...)$$

$$= (127, 151)$$

$$99\%$$
 confidence interval, so each tail is 0.025.  
Substitute in  $\overline{x}$  and  $\frac{\sigma}{\sqrt{n}}$ 

$$\frac{\sigma}{\sqrt{n}}$$
Answers should be given to at least 3 significant figures.

## **Statistics 3** Solution Bank

**21 a** Let  $W_C$  be the weight of a slice of cheesecake.  $W_C \sim N(135, 3^2)$ 

> Let  $W_B$  be the weight of the box.  $W_B \sim N(100, 6^2)$

Let  $W_T$  be the total weight of the box and 12 slices of cheesecake.

$$E(W_T) = E(W_B) + 12E(W_C)$$
  
= 100 + 12 × 135  
= 1720  
$$Var(W_T) = Var(W_B) + 12Var(W_C)$$
  
= 6<sup>2</sup> + 12 × 3<sup>2</sup>  
= 144  
$$P(W_T > 1700) = 1 - P(W_T < 1700)$$
  
= 1 - P $\left(Z_T < \frac{1700 - 1720}{\sqrt{144}}\right)$   
= 1 - P $\left(Z_T < -\frac{5}{3}\right)$   
= 1 - 0.04779  
= 1 - 0.04779  
= 0.9522

**b** The weights of each slice are independent.

22 A 95% confidence interval is

$$\overline{x} \pm 1.96 \times \frac{\sigma}{\sqrt{n}}$$

$$\overline{x} \pm 1.96 \times \frac{1.3}{\sqrt{n}} = 15.7096$$

$$\overline{x} - 1.96 \times \frac{1.3}{\sqrt{n}} = 14.6904$$

$$2 \times 1.96 \times \frac{1.3}{\sqrt{n}} = 15.7096 - 14.6904$$

$$\frac{1}{\sqrt{n}} = \frac{15.7096 - 14.6904}{2 \times 1.96 \times 1.3}$$

$$\sqrt{n} = \frac{2 \times 1.96 \times 1.3}{15.7096 - 14.6904}$$

$$\sqrt{n} = 5$$

$$n = 25$$

**23 a** A c% confidence interval is

$$\overline{x} \pm z \times \frac{\sigma}{\sqrt{n}}$$

$$\overline{x} + z \times \frac{3.6}{\sqrt{36}} = 16.2364 \Longrightarrow \overline{x} + 0.6z = 16.2364$$

$$\overline{x} - z \times \frac{3.6}{\sqrt{36}} = 12.9636 \Longrightarrow \overline{x} - 0.6z = 12.9636$$

$$2\overline{x} = 29.2$$

$$\overline{x} = 14.6$$

**b** Since

 $\overline{x} + 0.6z = 16.2364$  14.6 + 0.6z = 16.2364 z = 2.7273 P(Z < 2.7273) = 0.997By symmetry, P(-2.7273 < Z < 2.7273) = 0.994Therefore a 99.4% confidence interval.
